

Hollow-Piston Cylinder

version with internal thread,
single and double acting, max. operating pressure 500 bar

Description

The pistons of this cylinder range are provided with a through hole and internal thread. In connection with a standard tie rod and C-washer combination a variety of applications is possible, see application examples. The thread in the piston can be drilled out, if required. If the hollow-piston cylinder is mounted onto movable parts, e.g. clamps, the oil has to be supplied through a high-pressure hose.

Important notes

For operating pressures exceeding 350 bar only bolts, studs, or screws of material 10.9 must be used.

It is important to torque the lock nut used sufficiently to prevent damaging the piston threads.

Penetration of aggressive cutting lubricants and coolants through the sintered metal air filter into the cylinder's interior should be avoided by appropriate arrangement or covering.

Operating conditions, tolerances and other data see data sheet A 0.100.

When using single-acting hollow-piston cylinders, it is absolutely necessary to follow the instructions for venting of the spring area on data sheet G 0.110.

Installation possibilities

Application examples

Hollow-piston cylinders in combination with push-pull bolt and "C"-washer can be used advantageously in many cases to clamp workpieces with centre openings.

In the shown machine table, the workpiece is additionally supported by means of a work support after clamping with a hollow-piston cylinder in combination with a sequence valve as per data sheet C 2.954.

The support plunger of the work support is retracted in off-position to facilitate workpiece loading. Contact is effected by means of spring force.

The savings in workpiece exchange time, compared to a mechanical clamping system amounts to 58%.

This clamping fixture is for milling operation on a light extruded rail. Workholding by means of hollow-piston cylinders in individual clamping stations mounted on a base plate. Positioning and support of the rail is effected with two longitudinal members matching the cross section of the rail.
